                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to detecting (M1) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (Gs) identifie DNA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated GC, where differential expression of Gs is indicative of GCA. Also included are modulating (M2) GA by contacting GC with an agent that alters the expression of at least one gene in Gs; (2) screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

                                                                                      US-09-902-772-4 (1-478) x AAQ50662 (1-1890)
                                                                                                                                                                                                                                The intron-exon junctions of the human Ews gene and the Hum-Fli-1 gene have been sequenced (see AAQ50644 and AAQ50662, respectively). The different fusion products which could be formed by fusing exons from the two genes, as happens after specific chromosomal translocations, can be predicted (see AAQ50671-Q50678). The sequences at fusion junctions of other observed translocations are given in AAQ50679-Q50683). NOTE: the 1890 residue sequence AAQ50662 does not appear in the specification; it is a combination of the Hum-Fli-1 cDNA sequence (Fig 7, AAQ50644) and the individual intron sequences

                                derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene, expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes -

                                                                                               The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from hum liver. The single exon nucleic acid probes may be used for p measuring and displaying gene expression in samples derived fetal liver. The present sequence is a single exon nucleic a probe of the invention.

Note: The sequence data for this patent did not form part of printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              measuring human gene expression in a sample derived from human heart present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derifrom the human heart via microarrays. By measuring gene expression, probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The sequence data for this patent did no specification, but was obtained in electronic at ftp.wipo.int/pub/published_pct_sequences.

AAK40160
The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the hur bone marrow. They can be used to measure gene expression in bone man
                                                                                                                                                                                                09-AUG-2001.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (SENP). The present sequence is one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The

                                                                                                                                                                                                                                                      The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAI46176

Novel single exon nucleic acid probe used in a human breast -  $\,$ IJ No 6634; English. ç measuring gene expression

The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the prob hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumours.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO probe

CC The invention relates to a spatially-addressable set of single exon concluded acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 crobes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a concleic acid expressed in the human lung; measuring gene expression in a croarray comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung measuring sequences of the array; identifying exons in a eukaryotic genome, comprising (c) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, camprising a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single exon probe, camprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several conficorarrays having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single exon probe; and for identifying exons in a gene, particularly using human lung derived mRNA and for the study of lung diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  04-FEB-2000;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                   2436

Sequence 1, Application US/08878177

Patent No. 6294354

GENERAL INFORMATION:

APPLICANT: Chugai Seiyaku Kabushiki Kaisha, 5001, Iwam
ITILE OF INVENTION: Cell Calcification Suppressing Pro
ITILE OF INVENTION: the Proteins

FILE REFERENCE: chugai seiyaku Kabushiki kaisha 5001

CURRENT APPLICATION NUMBER: US/08/878,177

CURRENT FILING DATE: 1997-06-18

NUMBER OF SEO ID NOS: 7

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 1

LENGTH: 1447

TYPE: DNA

ORGANISM: C-11 gene, c-erg gene w/ deletion, chicken
                                                                                                                                  Qy

APPLICANT: Deneris, Evan S.
APPLICANT: Fyodoro, Dmitty V.
APPLICANT: Hyodoro, Dmitty J.
APPLICANT: Hendricks, Timothy J.
TITLE OF INVENTION: Reagents and Methods for the Screening of Compounds
TITLE OF INVENTION: Useful in the Treatment of Neurological Diseases
FILE REFERENCE: CASE-04027
CURRENT APPLICATION NUMBER: US/09/435,335
CURRENT FILING DATE: 1999-11-05
EARLIER APPLICATION NUMBER: 09/360,779
EARLIER FILING DATE: 1999-07-26.
NUMBER OF SEQ ID NOS: 23
